

Meeting with Marc: New Underwriting Project

Summary, dialogue and checklist | Recording: "New Project - MiniMeetingwithMarc" (5:20) | Prepared October 8, 2026

The conversation runs from about 0:30 to 2:20; after that the recording is mostly background noise, and the first 30 seconds are greetings that weren't intelligible. The audio was transcribed with two offline speech-to-text models and reconciled by hand. Unclear words are marked [unclear] or shown as a best guess in [brackets].

Summary

Marc is moving Brandon off current work onto a new project, working directly with **Abraham**. The goal is to automate how the company evaluates properties for investment: **drop an Offering Memorandum (OM) into the AI, and it fills in the underwriting spreadsheet with no human data entry.**

- **The spreadsheet is very specific.** A computer programmer has worked on this for **7 months** and still hasn't gotten it to work.
- **Timeline:** Marc expects it to take many weeks, though Brandon might solve it in a week.
- **Abraham should sit with Brandon.** He is the spreadsheet expert and needs to explain how it works and answer questions.
- **It will take almost all of Brandon's time** for at least a couple of weeks. Current work (the referral flyer and the collections/vacancy check) goes on hold.

This matches the files already in the project folder: the Cambridge Court OM, the GPC Underwriting Model Template, and the completed "CA - Cambridge Court_v4_**AR**" model. "AR" may be Abraham's initials, which would make that file his finished example of what the AI needs to produce.

Dialogue

0:00–0:30 *Greetings and small talk (mostly unclear).*

0:31	Marc	I want you [downstairs] for a new project.
------	-------------	--

0:35	Marc	You're going to be working directly with Abraham to figure out... we had coded another system to handle how we evaluate properties for investment. I won't give you too much detail, 'cause [he'll go over] all the details. Basically, we take these offering memorandums — you've seen that before?
------	-------------	---

	Brandon	Yeah.
--	----------------	-------

0:59	Marc	And then you drop the offering memorandum into the AI, and then it has to input everything into our spreadsheet, with no human entry. That's our goal.
------	-------------	--

	Brandon	Okay.
--	----------------	-------

1:10	Marc	The spreadsheet's very specific. I've had a guy working on it for seven months, and he hasn't got it to work yet. And he's a computer programmer.
------	-------------	---

	Brandon	[Wow.] Okay.
--	----------------	--------------

1:21	Marc	So, um, I'm hoping that with your skill set you'll be able to, um, figure it out. [I'm anticipating] this is going to take many weeks. We have to have Abraham there next to you, because when you have questions—
------	-------------	--

	Brandon	Yeah.
--	----------------	-------

1:36	Marc	He's very good. He needs to explain the things [to you], what's going on. So what are you working on now?
1:44	Brandon	Well, I was doing that flyer [unclear]... and I was comparing the collection stuff, making sure it's correct with the vacancy reporting. I did the math to make sure the collections actually were correct.
2:01	Marc	So let's [put that] down now, so you can get started on this. This will be consuming almost all your time for a couple [weeks] at least. And who knows, you may find the solution in a week.
2:15–5:20		<i>[Unclear closing remark], then background noise. No more conversation.</i>

Checklist

Start-up

- ☐ Pause the referral flyer and the collections/vacancy check, and tell whoever is expecting them.
- ☐ Book regular time with Abraham, ideally sitting together as Marc asked.
- ☐ Find out who the programmer is who spent 7 months on this. Ask what they built, where it failed, and whether you can see their code.
- ☐ Get access to the "other system" Marc said was already coded, if it's separate from the spreadsheet.

Questions for Abraham

- ☐ Which spreadsheet is the official one? Is it the GPC Underwriting Model Template v4?
- ☐ Is "CA - Cambridge Court_v4_AR" his finished example for Cambridge Court? Use it as the answer key to test the AI's output.
- ☐ Which cells or tabs must the AI fill in, and which are formulas that should be left alone?
- ☐ Does the AI only read the OM, or also the seller's T-12, rent roll and payroll file (like the Cambridge Request .xls)? Much of the model comes from those, not the OM.
- ☐ Which assumptions are his judgment calls rather than OM data (insurance, management fee, exit cap rate, loan terms)? Those may need fixed defaults or his sign-off.
- ☐ How should the scenarios (vouchers, 8% LIHTC increase, new vouchers) be set up for each deal?
- ☐ Ask about the issues found in the Cambridge model: Scenario 1 matching Scenario 0, the 10/90 vs 25/75 equity split, and the \$1.32M of fix-up costs that never gets spent.

Defining done

- ☐ Agree with Marc and Abraham on what "working" means: fully hands-off, or the AI fills it in and a person reviews?
- ☐ Gather 3–5 more past OMs with their finished models to test on more than one deal.
- ☐ Set a weekly check-in with Marc. He expects weeks, but said it might be solved in one.

Setup

- ☐ Keep the GitHub repo (new-project-underwriting-rentroll-automation) private, since the seller files include tenant and employee names.
